ARTIBAND: Development of an artificial intelligence platform for the design of protein-protein modulation drugs

Description

The main objective of this proposal is to develop new tools based on artificial intelligence to find active molecules capable of antagonizing protein-protein contacts or acting as molecular glues of proteins of pharmacological interest, in particular targets for immune-mediated inflammatory skin conditions.

Proyecto CPP2022-009737 financiado por MICIU/AEI /10.13039/501100011033 y por la Unión Europea NextGenerationEU/ PRTR

Barcelona Supercomputing Center - Centro Nacional de Supercomputación
